Sealants

Are your child's teeth well protected?

SEALANTS

Not without Dental Sealants!

What are they?

Dental sealant is a thin coating, (white, clear or lightly tinted) that is applied to the biting surfaces of back teeth to protect the deep grooves where cavities often begin.

Prevent cavities!

Sealants prevent cavities by providing a barrier that prevents acid-producing bacteria and plaque from settling into tiny crevices and causing decay.

Save money!

Less expensive than restorative work, sealants can be a real money-saver, too!

Effortlessly!

Application is relatively fast, requires no anesthetic and is painless. The benefits last for years.
